Workflow Refinery

Human-guided compute, with clear evidence gates

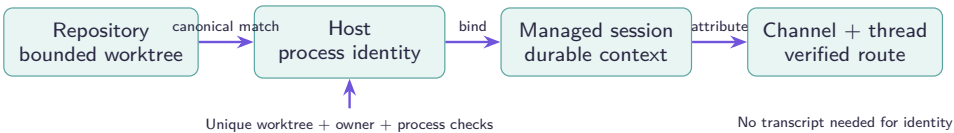

Public synthetic concept

October 2026

Five substantive mechanisms + three visual complements. Solid teal: observed pattern or stated premise. Dashed amber: proposal.

1 / Durable identity binding

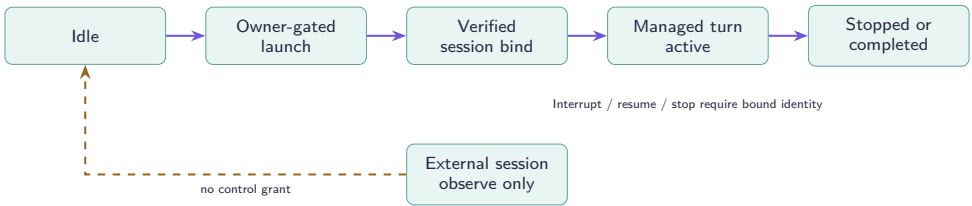

A repository label alone cannot authorize a session or a message route.

Substantive – identity and attribution

2 / Managed-session lifecycle

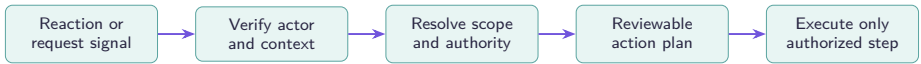

Owner-gated controls apply only after a verified managed-session bind. External sessions remain observation-only.

Substantive – session control

3 / Evidence is not authority

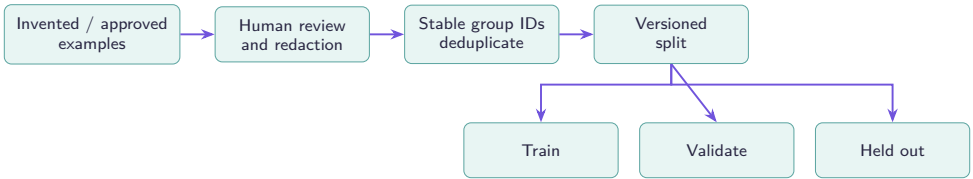

A reaction prompts verification of actor, scope, target, and limits before execution.

Substantive – approval workflow

4 / Reviewed golden-data provenance

The existing offline pilot uses invented reviewed examples, stable groups, fixed splits, and deterministic gates. These are not model-quality results.

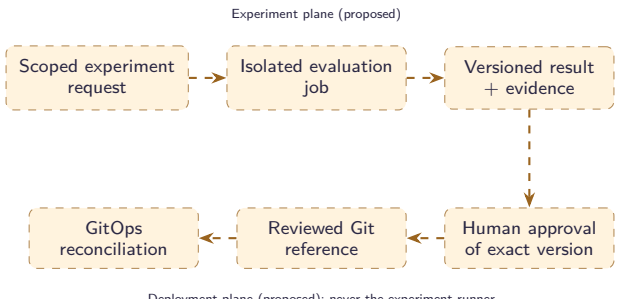

Offline format / privacy / leakage gates; no quality claim

Substantive – data and evaluation

5 / Separate control planes

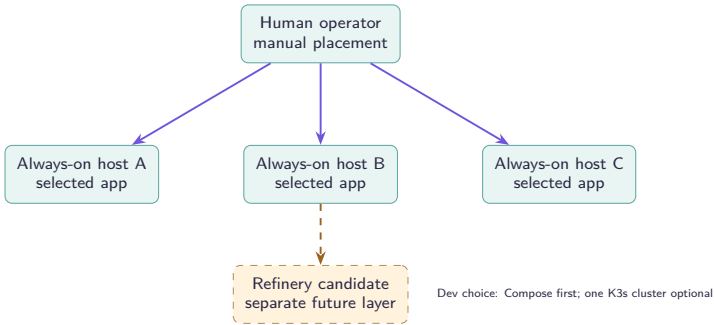

The proposed experiment job produces evidence. A distinct human-approved Git path would promote a pinned artifact. Nothing is deployed by this demo.

Substantive – promotion architecture

6 / A simple compute constellation

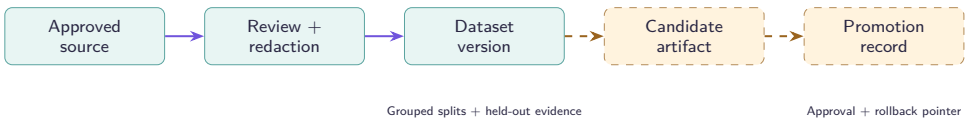

Assume always-on machines and human app-to-host placement. Compose first; one K3s cluster is optional. The refinery is a future layer.

Visual complement – development topology

7 / End-to-end provenance

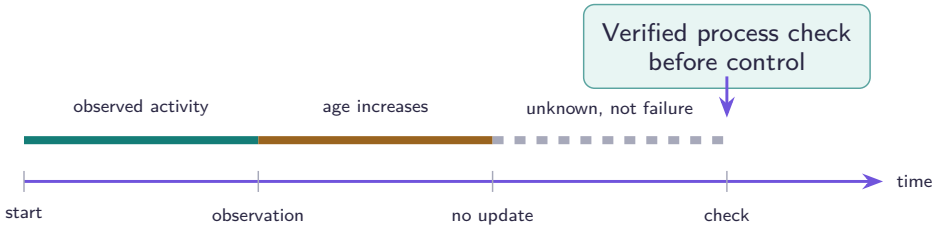

A future candidate must trace back to authorized source, review, dataset version, and an approval with rollback reference.

Visual complement – lineage

8 / Observation is not failure

A missing update makes status uncertain. A process check, not elapsed silence, should precede control.

Visual complement – freshness

What remains hypothetical

- Smaller-model cost and quality improvements require permissioned measurement.
- The refinery control plane, artifact promotion, and cluster options are proposals.
- No private-chat ingestion, live training, provider calls, or autonomous external actions occur here.

Public design context: dots-dspy-refinery-architecture and dots-local-sidecar-cloud-infrastructure.
